

(a couple of times a year)

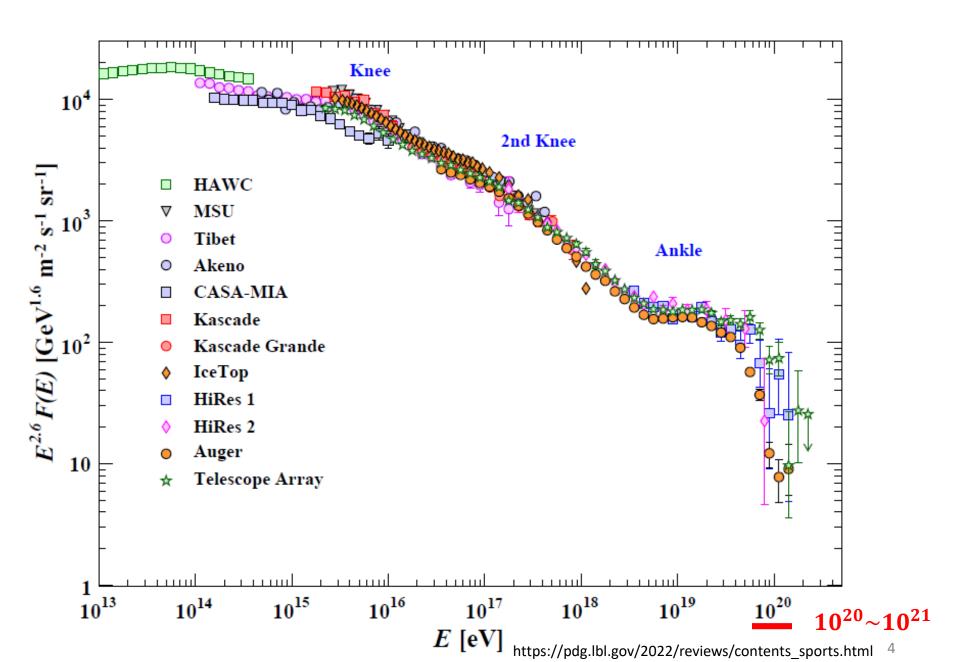

# What are Cosmic Rays?

- Particles from the outside of the Earth (1ry cosmic rays)
  - 90% of them are hydrogen nuclei (protons)
  - They interact with nitrogen and oxygen nuclei in the atmosphere and generate 2ry cosmic rays.
    - Muons and neutrinos are also generated.
- Typical CR muon energy is ~1-100 GeV

# **Cosmic Ray Spectrum**

# Why $10^{20} \sim 10^{21}$ eV?

High energy protons interact with Cosmic Microwave Background (CMB):

$$p + \gamma_{\rm CMB} \rightarrow \Delta^+ \rightarrow n + \pi^+$$

What is the threshold energy  $E_p$  of such a proton ?

$$(E_p + E_{\text{CMB}})^2 - (p_p - E_{\text{CMB}})^2 = (m_n + m_{\pi})^2$$

Assuming  $E_p=p_p$  because of high energy, we obtain

$$E_p = \frac{(m_n + m_\pi)^2}{4E_{\text{CMB}}}$$

$$E_{\rm CMB} = 8.62 \times 10^{-5} {
m [eV~K^{-1}]} \times 2.7 {
m [K]} = 2.33 \times 10^{-4} {
m [eV]},$$
 and  $m_n = 940 {
m [MeV]}$ ,  $m_\pi = 140 {
m [MeV]} o E_p = 1.25 \times 10^{21} {
m eV}$  (consistent with measurements)

The number of UHE CR coming to the Earth is suddenly suppressed at the energy of  $\sim\!10^{20}$  eV .  $\Rightarrow$ 

**Greisen-Zatspin-Kuzmin (GZK) Cutoff** 

## Primary cosmic-ray flux

## **Chemical composition**

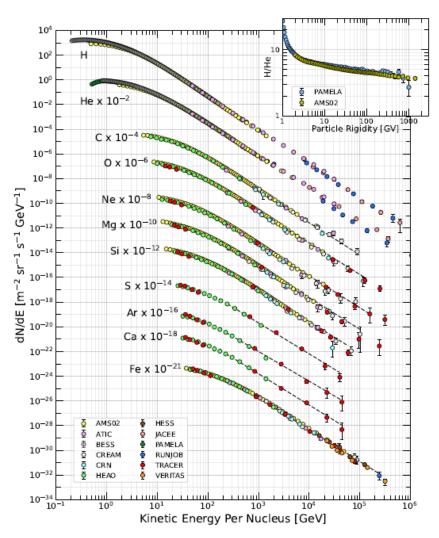

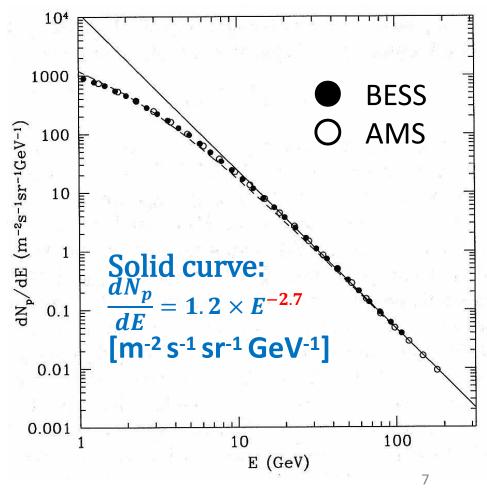

Figure 30.1: Fluxes of nuclei of the primary cosmic radiation in particles per energy-per-nucleus are plotted vs energy-per-nucleus using data from Refs. [1–15] The inset shows the H/He ratio as a function of rigidity [1,3].

### 1ry CR proton energy distribution

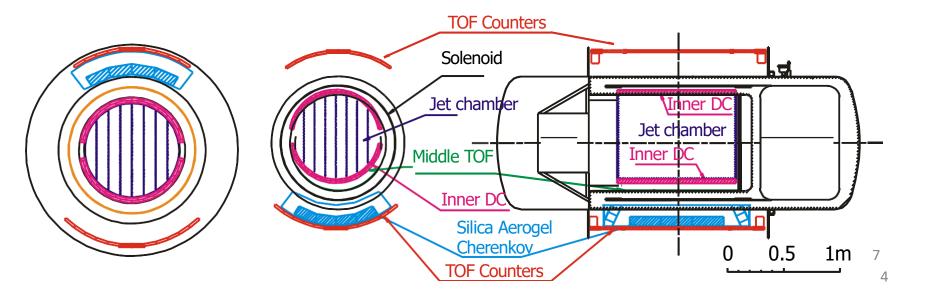

# Balloon-borne Experiment with a Superconducting Spectrometer (BESS)

BESS-2000

- Collaboration between Japan and US(KEK, Univ.of Tokyo, Kobe Univ., JAXA, NASA, and Univ.of Maryland)
- Purposes
- Precision measurement of low energy
   1ry CR antiprotons
- 2. Search for CR antimatter (anti He nucleus)
- 3. Precision measurement of 1ry CR proton and helium energy spectrums etc.
- Site: Lynn Lake (Canada), Antarctica

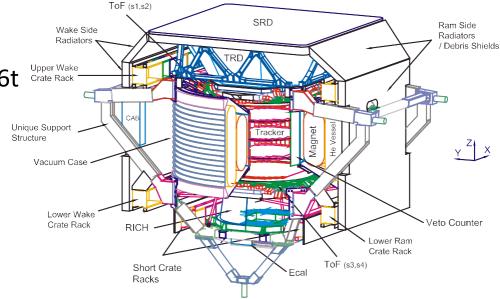

## Alpha Magnetic Spectrometer (AMS)

 Particle physics detector on the international space station for the cosmic ray measurement.

- Large area and solid angle
- Superconducting magnet + Si detector
- Good particle identification (PID)
  - TRD
  - RICH
  - ECAL 15 $X_0$
- Total weight: 6t

# Cosmic ray flux measurements

Japanese American Cooperative Emulsion Experiment (JACEE): Direct measurements of 1ry CR components and energy spectrum in <u>Antarctica</u> Balloon-borne experiment

#### Russia-Nippon Joint Balloon Experiment (RUNJOB)

purpose: measuring the chemical compositions and energy spectra of the primary cosmic ray, balloon, **Russia** 

#### **HEAT (High-Energy Antimatter Telescope)**

purpose: study of CR  $e^-e^+$ , isotopic composition, balloon, New Mexico & **Lynn Lake (Canada)** 

#### **TRACER (Transition Radiation Array for Cosmic Energetic Radiation)**

purpose: direct measurements of the heavier primary cosmic-ray nuclei at high energies, balloon, **Antarctica** 

#### **ATIC (Advanced Thin Ionization Calorimeter)**

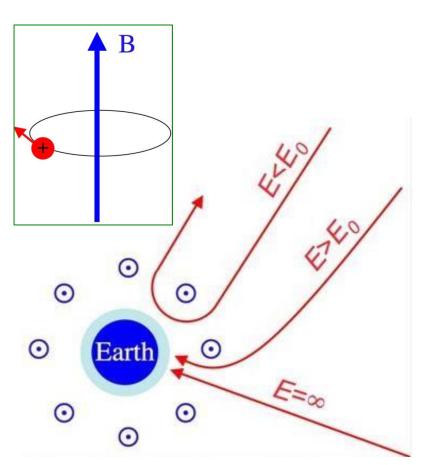

purpose: measuring the energy and composition of cosmic rays, balloon, Antarctica

### **CREAM (Cosmic Ray Energetics and Mass)**

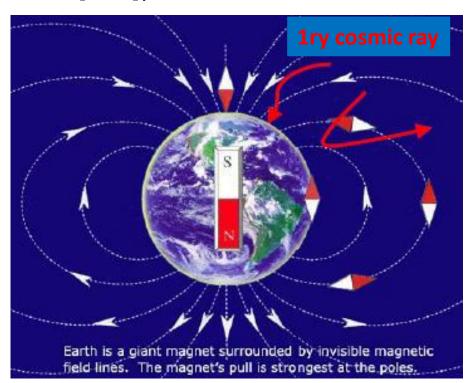

purpose: determining the composition of cosmic rays up to the 10<sup>15</sup> eV (also known as the "knee prospect") in the cosmic ray spectrum, balloon, **Antarctica** 

# Why at high latitude?

To lower the cut-off rigidity  $R_c$ . The rigidity R = p/z, where p is the momentum and z is the charge (R for a proton of p = 1 [GeV] is 1 [GV], and for a helium of p = 1 [MeV] is 0.5 [MV]).

Plan view from the north pole

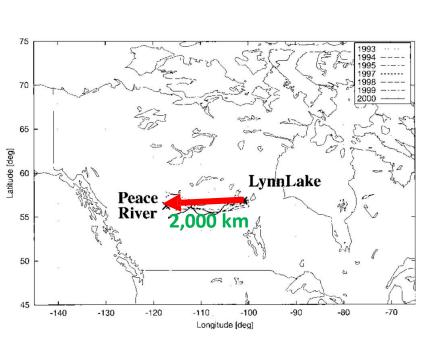

Estimate Rc. Magnetic field  $B \approx 5 \times 10^{-5}$  [T] at the altitude  $h \le 7 \cdot 1,000$  km.

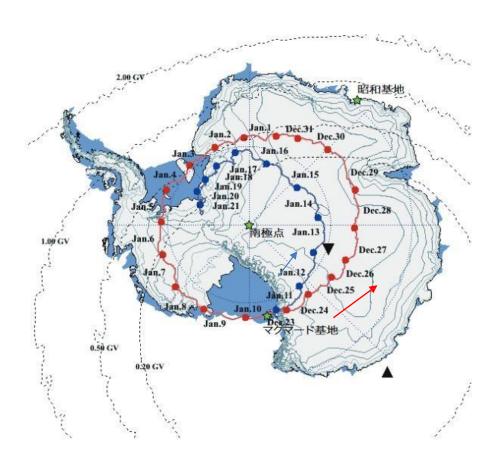

$$Rc = 0.3hB$$
  
=  $0.3 \times 10^6 \times 5 \times 10^{-5} = 15$  [GV]

Tokyo:  $R_c \approx 11 \, \text{GV}$ 

# Why especially in Antarctica?

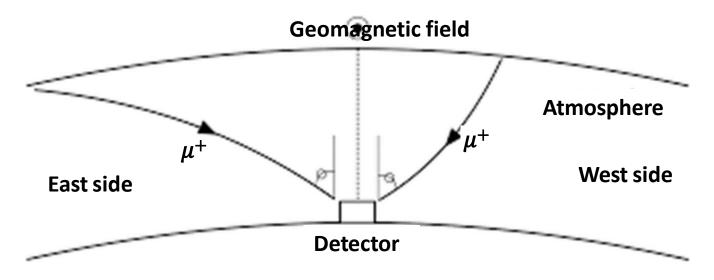

One way track ~ 20 ~ 30 hour flight

Circling orbit ~1 month flight

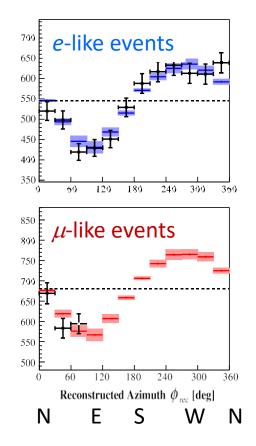

## **East-West effect**

Charged cosmic rays receive a Lorentz force from the geomagnetic field. Due to the direction of the field from the south to north, positively charged particles from the west receive the force to outside and those from the east receive the force to inside. Therefore we observe the particle from the west more than those from the east.

# **Result of SK**

- ν's from west > ν's from east
   → more positively charged
   particles than negatively charged
   ones

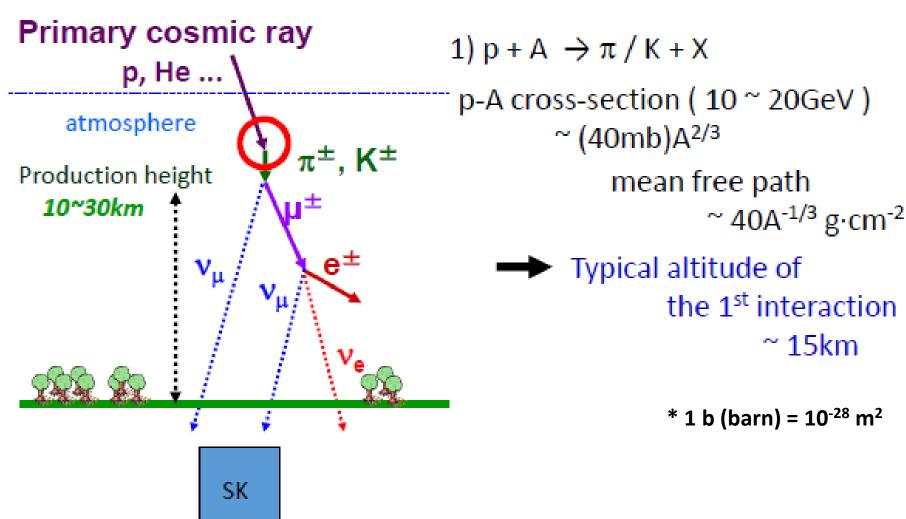

Points: data

**Boxes: simulation** 

PhysRevD.94.052001

## 2ry cosmic ray generation

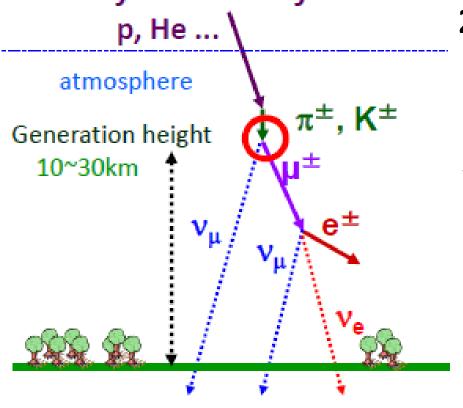

1ry cosmic rays interact with N, O, C, etc. in the atmosphere.

# **2ry cosmic ray generation**

1ry cosmic rays interact with N, O, C, etc. in the atmosphere.

Primary cosmic ray

2) Decay of  $\pi$ How far can 5 GeV charged pions travel ?

$$\gamma c \tau_{\pi} = \frac{E_{\pi}}{m_{\pi}} c \tau_{\pi} = 278 \text{ m} \sim 300 \text{ m}$$
(3.6 g/cm<sup>2</sup>)

\*note: interaction length of

$$\pi$$
~160 g/cm<sup>2</sup>

**Most pions decay** 

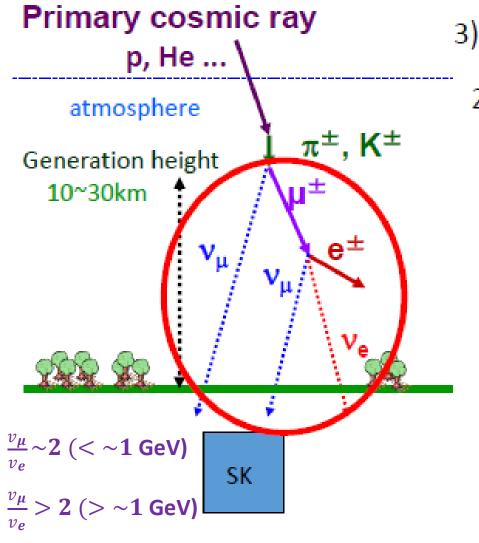

$$\pi \rightarrow \mu + \nu_{\mu}$$

SK

$$c=3 imes 10^8\,\mathrm{m/s}$$
 ,  $m_\pi=140\,\mathrm{MeV}$  ,  $au_\pi=2.\,6 imes 10^{-8}\,\mathrm{sec}$ 

# **2ry cosmic ray generation**

1ry cosmic rays interact with N, O, C, etc. in the atmosphere.

3) fate of  $\mu$ 

2.5 GeV muons from life ~15 km energy loss ~ 2GeV

 $\rightarrow \begin{cases} \text{decay} & \mu \rightarrow e + \nu_{\mu} + \nu_{e} \\ \text{hit the ground} \\ \text{absorption (} \mu^{-}\text{)} \\ \text{decay} \end{cases}$ 

Lower energy  $\mu$ Decay
Higher energy  $\mu$ Can not decay

## Zenith angle and energy distributions of cosmic ray

# Since the energy loss is 2 MeV/(g/cm<sup>2</sup>) for high energy charged particles, minimum energy $E_{min}$ of the particle which can reach the surface is

$$E_{min} = \frac{2 \text{ [GeV]}}{\cos \theta}$$

Number of incident particles:

$$N(E > E_{min}) = \int_{E_{min}}^{\infty} n(E) dE$$

$$\propto \int_{E_{min}}^{\infty} E^{-\gamma} dE$$

$$= \frac{2^{1-\gamma}}{\gamma - 1} \cos^{\gamma - 1} \theta$$

Upper layer of the atmosphere  $E_{min}$ : minimum energy Thickness of the to go through this atmosphere ≈1,000 g distance Surface

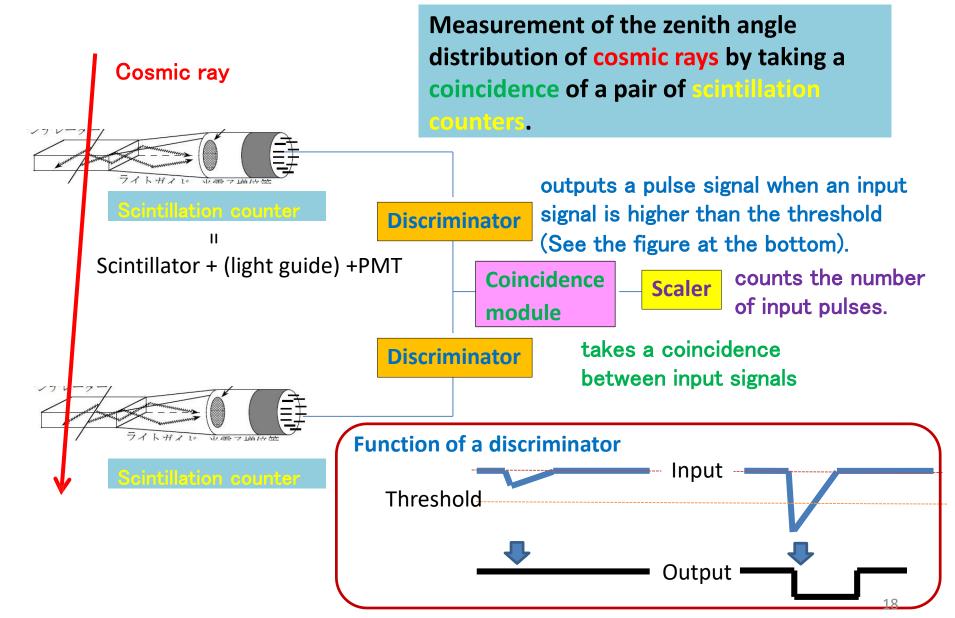

1ry CR

From measurements, we can get

$$\gamma - 1 \approx 2 \rightarrow \gamma \approx 3 (2.7)$$

# Simple experiment (1)

(CR flux measurement)

# Simple cosmic ray experiment(1)

Measurement of the zenith angle distribution of cosmic rays by taking a coincidence of a pair of scintillation counters.

Discriminator

outputs a pulse signal when an input signal is higher than the threshold.

Coincidence module

Scaler

counts the number of input pulses.

**Discriminator** 

takes a coincidence between input signals

L: distance between the scintillators

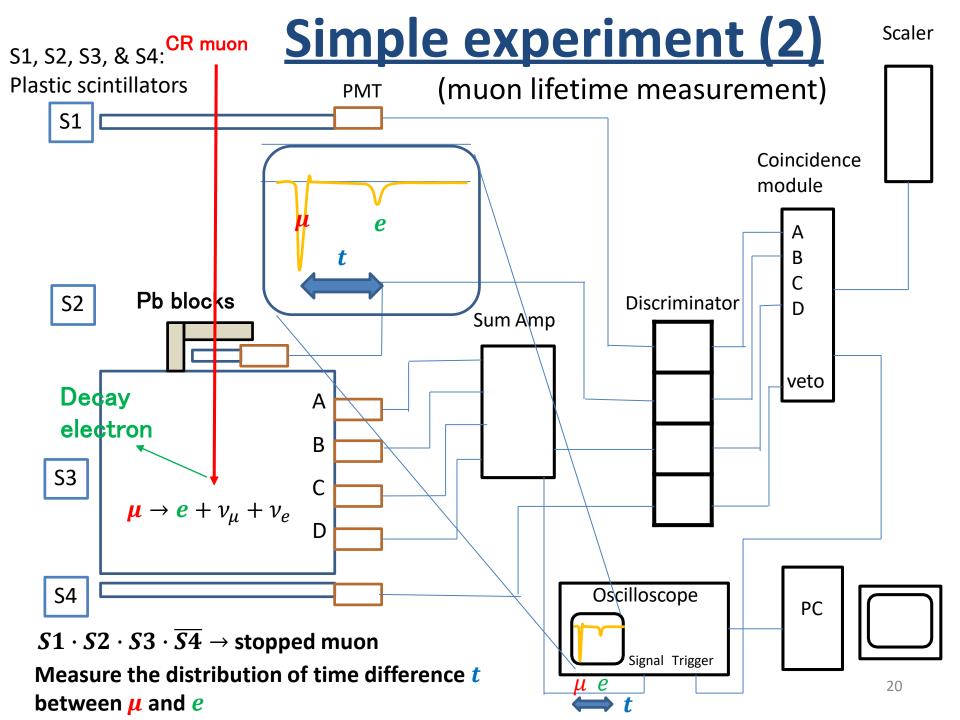

S: area of the scintillator

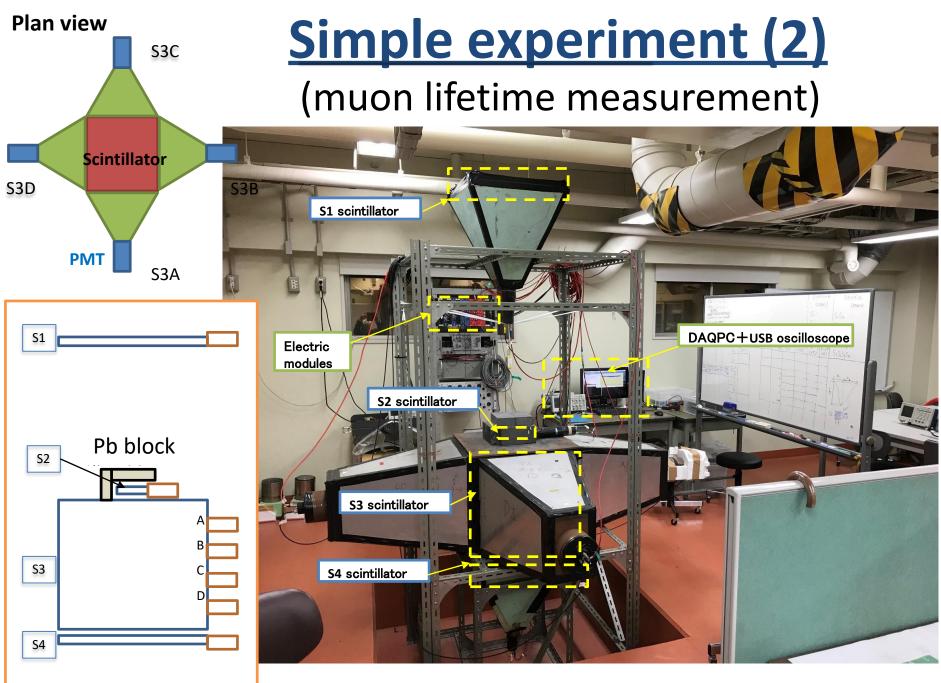

N: number of events

T: measurement time

Flux:  $\Phi = \frac{N}{S\Omega T} \approx \frac{L^2N}{S^2T} \sim 100 \text{ m}^{-2}\text{s}^{-1}\text{sr}^{-1}$  (typical sea-level value about vertical direction)

 $\propto \cos^2\theta \rightarrow \gamma - 1 \approx 2 \rightarrow \gamma \approx 3$  (2.7) :consistent with the measurements

# Simple experiment (2)

## Exercise (homework)

1. Particle decay follows the following formula:

$$N = N_0 e^{-t/\tau},$$

where N and  $N_0$  are the numbers of events at time t and 0, respectively, and  $\tau$  is the lifetime.

The right side table is a result of the muon decay experiment.

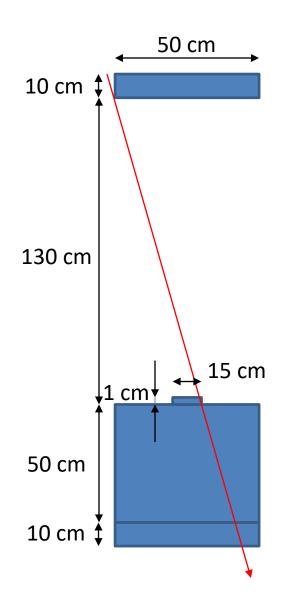

- (a) Make a plot of the number of events as a function of the decay time. Use log scale as a vertical axis.
- (b) Get the muon lifetime.
- 2. Some events show no 2<sup>nd</sup> signal which corresponds to decay electron. What are those events?

Decay time	Number	Decay time	Number
$t [\mu sec]$		$t [\mu sec]$	of events
0.3	1501	4.7	194
0.5	1308	4.9	189
0.7	1191	5.1	155
0.9	1082	5.3	157
1.1	1024	5.5	127
1.3	886	5.7	134
1.5	823	5.9	102
1.7	775	6.1	90
1.9	700	6.3	96
2.1	610	6.5	79
2.3	544	6.7	62
2.5	547	6.9	85
2.7	497	7.1	65
2.9	463	7.3	61
3.1	422	7.5	53
3.3	380	7.7	66
3.5	340	7.9	41
3.7	291	8.1	28
3.9	276	8.3	29
4.1	283	8.5	26
4.3	245	8.7	27
4.5	204		

<sup>\*</sup> ex. "0.3" means  $0.1 \le t < 0.4 \, [\mu \, \text{sec}]$ 

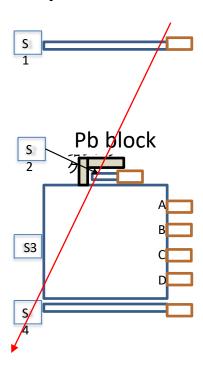

<sup>\*</sup> Note that the condition in the next page.

# **Real Geometry of the Detector**

Since S2 is small and the distance between S1 and S3 is long enough, particles which pass through S1, S2, and S3 always reach S4.

(There is no event which passes through S1, S2, and S3, but does not pass S4 like the following one: )

# **Summary**

## As introduction to cosmic rays:

- What are cosmic rays?
- Cosmic ray spectrum
- Geomagnetic effect
- 2ry CR generation including atmospheric neutrinos –
- Simple experiments Student experiments of Kobe Univ.

In addition to above, I gave you a homework (it is not a duty but I would like you to do).
